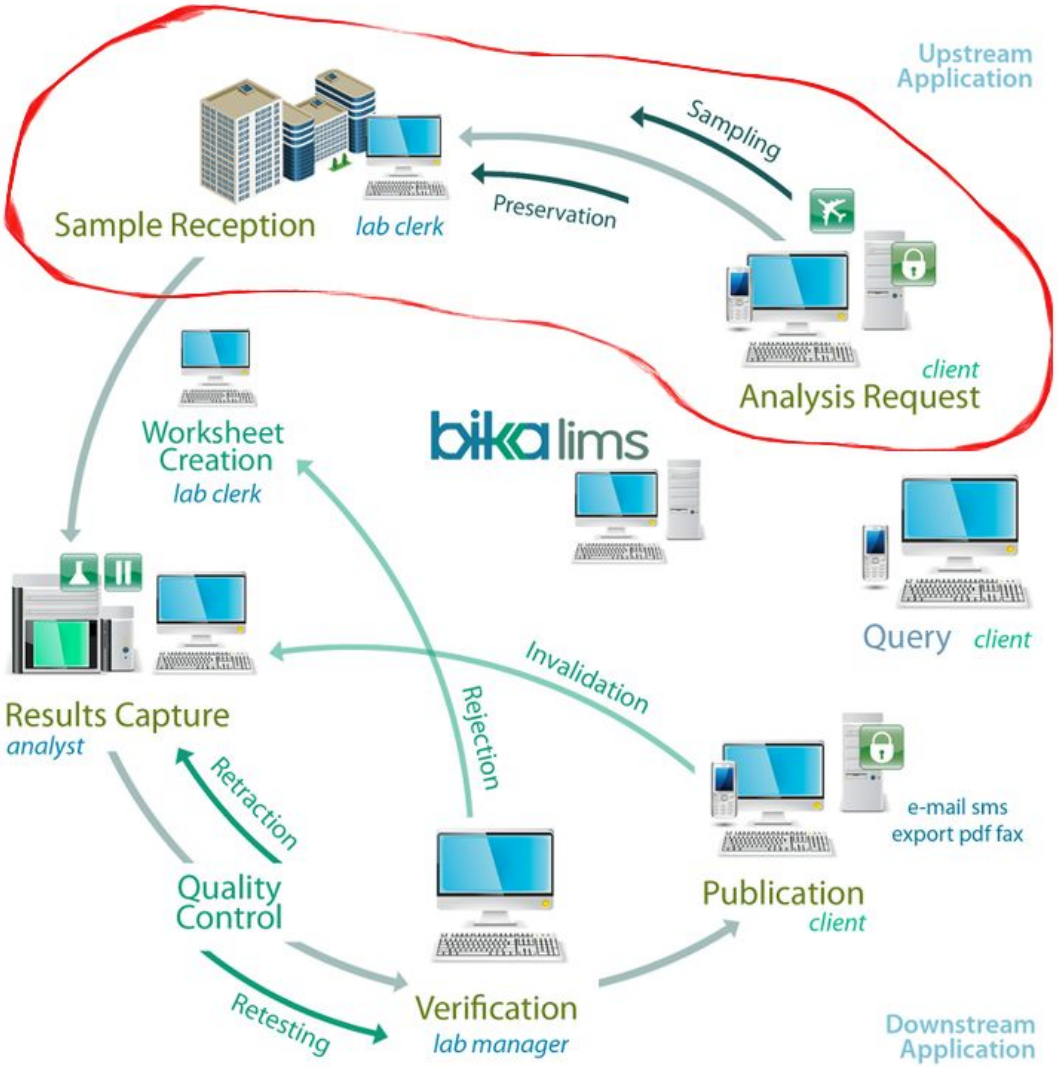
Use case for BIKA-LIMS

For the first sprint the use case is as follows.

- The sql database will save all the fields in the BIKA-LIMS
- There will be a one to one mapping between objects and the database.



In the first sprint the above work-flow related use case will be covered. The data entities in the database will be Users, Client (mapping table Users who are clients), Lab Clerk(mapping table Users who are Lab Clerks), Samplers (mapping table Users who are samplers), Preservers (mapping table Users who are preservers). Obviously records in these tables can be theoretically mapped to ZODB objects in BIKA-LIMS. For the mapping, collection.transmogrifier pipeline will be used.
